### **WARRANTY**

All TankGuard, Inc. products are warrantied for 1 year of service, but in no case more than 2 years beyond the original date of purchase. TankGuard warrants the product as free from defects in materials and workmanship under normal recommended use.

In order to consistently bring you the highest quality, full-featured products, we reserve the right to change our specification and designs at any time. TankGuard products and logo are the trademark of TankGuard. This document, including textual matter and illustrations, is copyright protected by TankGuard, with all rights reserved.

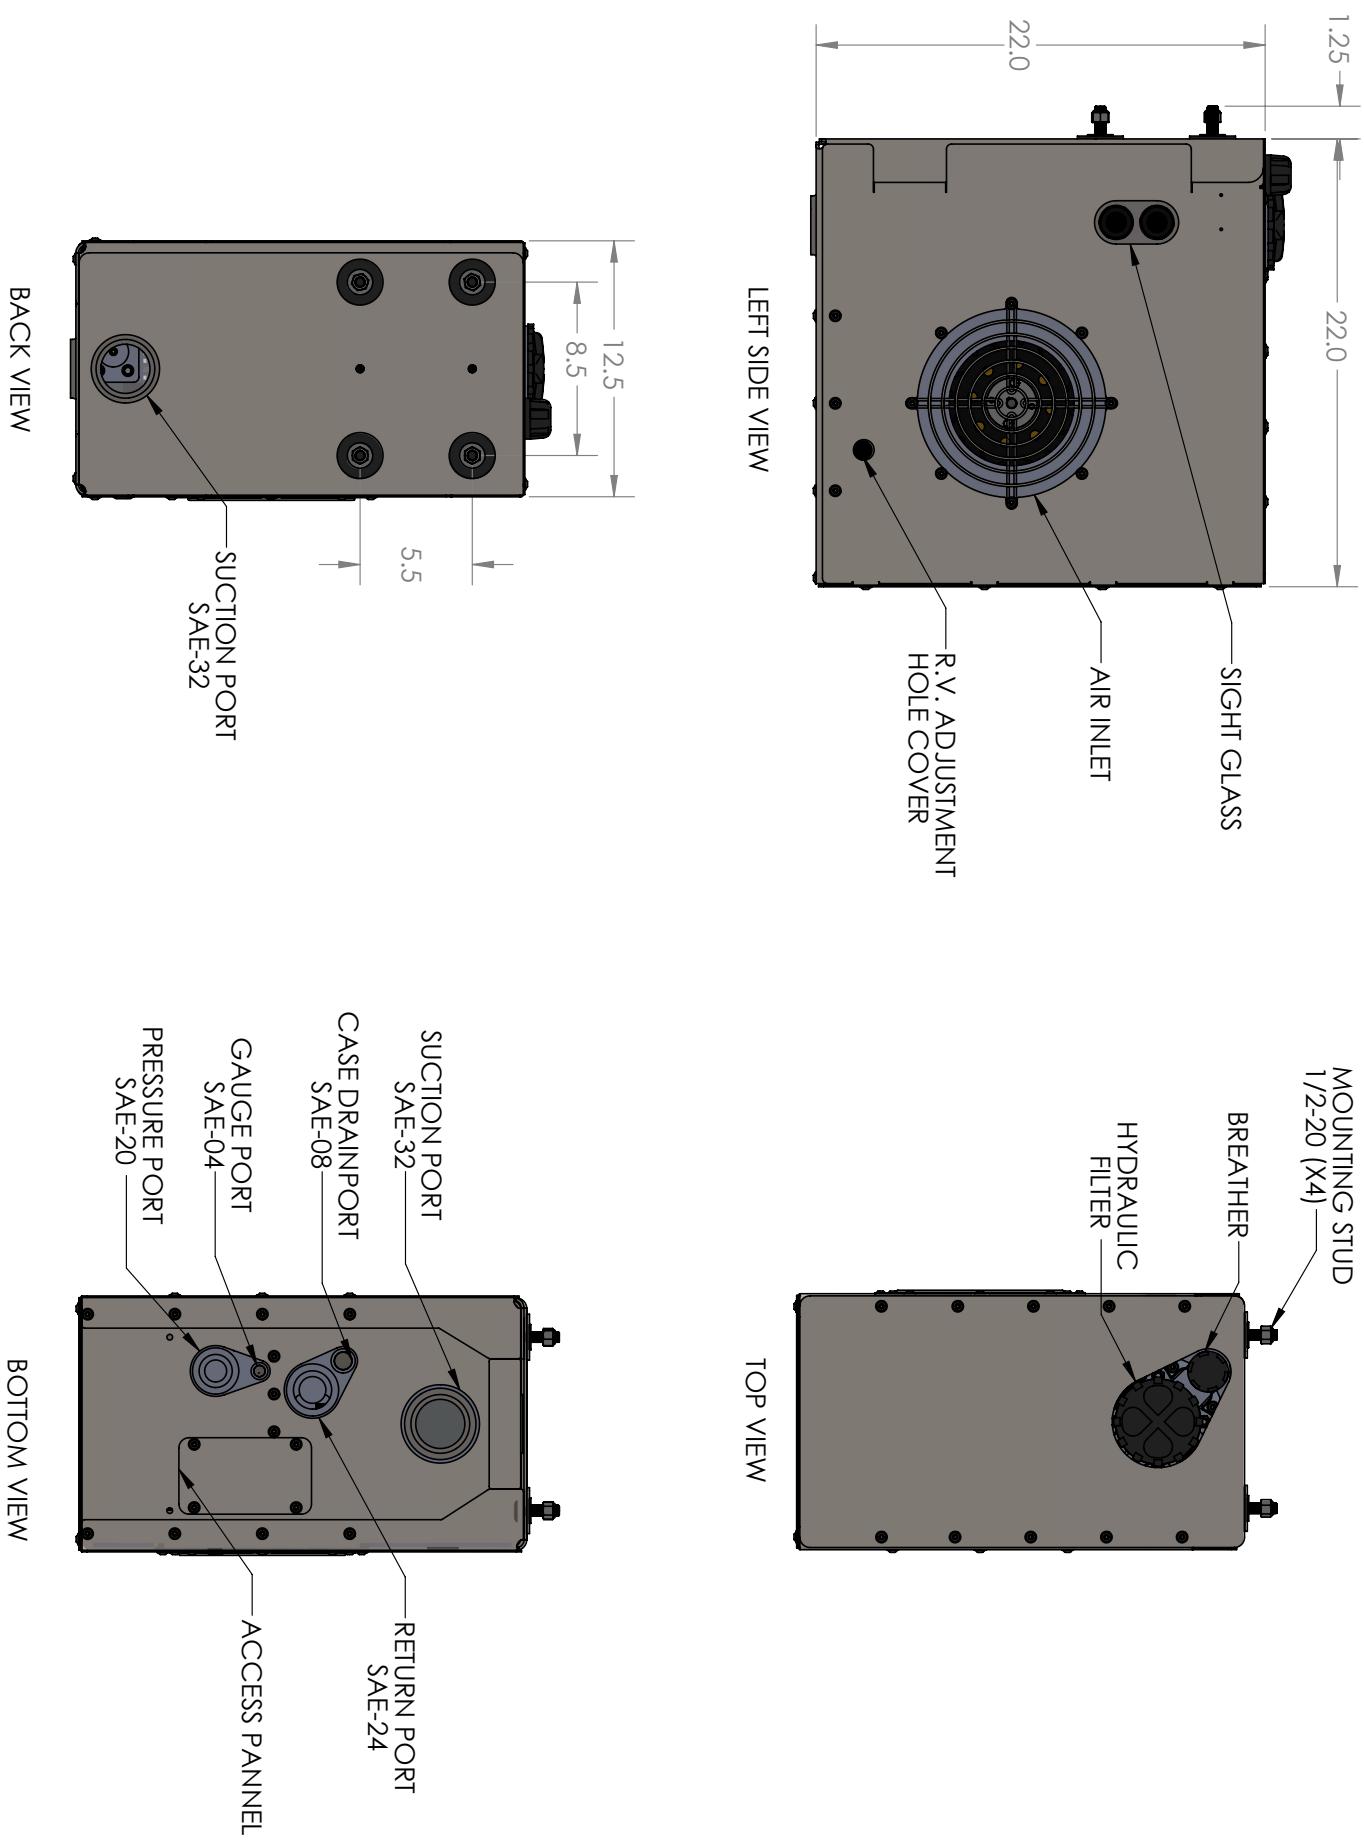

# **TANKGuard**

## **FEATURES INCLUDE:**

- Stainless Steel Construction
- The basic size of our cooler is 22"x22"x12.5", making it the most compact cooler in its class.
- 6 Gallon Hydraulic Reservoir
- Weight: 140 lbs dry, making it the lightest hydraulic cooler in its class
- Flow Rate to 60gpm
- Pressure rated to 3000 psi
- Heat rejection is 28HP at 60gpm with 80°F ETD. This is the highest heat rejection in its class
- Hydraulic filter - This filters your return fluid with a ten micron filter, has an integral bypass valve, and baffle. It also conveniently filters the oil that is added to the reservoir.
- Filter Element = 10 micron
- Filter Bypass valve- Set at 36 psi. This feature protects the filter from over pressurization due to cold oil or a blocked element.
- System Cold Oil Bypass Valve - Set at 60psi. This feature ensures that the low pressure side of the hydraulic system stays at a low pressure. Primarily protects from over pressurization due to cold oil.
- System relief valve - This Feature ensures that the maximum system pressure does not go any higher than what you set the valve at. Factory set at 3000psi and is adjustable from 500psi to 3000psi.
- Flow control valve - This feature ensures the delivery of consistent flow to the hydraulically powered cooling blower motor. It is factory set to ensure the most efficient blower speed.

**FIGURE 1: TGHC-60 Dimensions**

# INSTALLATION & OPERATION

**Warning: High Pressure oil can cause severe injury.** Turn off PTO and bleed pressure before servicing hydraulic system.

**Warning: heavy object.** To avoid muscle strain or back injury, use lifting aids and proper lifting technique when removing or replacing.

**Warning: Rotating Fan Blade.** Can cause serious injury or cut. Keep hands clear. Turn off and lockout unit before servicing.

**Caution: Surface May be Hot.** Ensure PTO is off and unit has cooled before servicing.

## POSITIONING AND MOUNTING:

The TGHC-60 is designed to fit in very tight spaces, its narrow profile allows for behind the cab or frame rail mounting. Unit will ship with a mounting template to aid in proper installation. (See FIG. 6) The TGHC-60 requires at least 2" air gap on the fan shroud side to allow for adequate air intake.

## CONNECTIONS (SEE FIG.2):

Note: SAE ports do not require a thread sealant, they seal with an o-ring. Make sure your SAE fittings have a properly sized o-ring and are free of thread sealant.

**Suction Port -32 SAE** – Your hose will go from this port to the pump inlet port. Minimum hose size - 2".

**Pressure Port -20 SAE** – The hose from your pump output will "T" into this port. One side of the "T" supplies the 2.25gpm to the hydraulic fan. Flow will only be greater than 2.25gpm through this line if the pressure relief valve setting is exceeded. The other side of the "T" runs to the motor input or control valve input depending on your system. Minimum hose size - 1.0".

**Case Drain -8 SAE** – Some hydraulic pumps, motors, and control valves have a case drain line that needs to be plumbed directly back to the cooler reservoir. This is where you will make that connection. If your hydraulic system does not require a case drain line simply leave the TankGuard provided hex plug in this port. This plug also doubles as the drain plug for the tank.

**Return Port -24 SAE** – The hose from the outlet of your motor or control valve should be plumbed into this port. This port takes all of the return flow from your motor and sends it through the filter and heat exchanger built into the TGHC-60. Minimum hose size - 1.5".

**Gauge Port -4 SAE** – This is a test port on the bottom of your cooler. This port is connected to the input port of the manifold, for the purpose of connecting diagnostic equipment like a gauge or transducer to system pressure.

## START UP PROCEDURE:

This Unit comes ready to install, no assembly required.

Make up all hydraulic connections.

With the PTO disengaged, remove filter cap from top of cooler. Leave filter in place and add fluid until the bottom gauge is full and the top gauge is empty as shown. This will filter the fluid as it is being added. Even new hydraulic fluid should be filtered. You will need to add hydraulic fluid in slowly because the filter is in place.

Bleed air from lines and check fluid level again. Ensure that the lines are full of fluid and the air is bled from your system, some pumps and motors, particularly piston will be ruined in a matter of seconds if operated without fluid.

Depending on the length and diameter of the system hoses you may need to add fluid to the reservoir several times.

Install filter cap.

Slowly engage PTO with engine at idle speed.

Check for hydraulic leaks and repair as needed

Check for fan operation. Note that the fan will turn slowly when system pressure is low.

Recheck reservoir fluid level. Each time you add fluid disengage PTO, if the reservoir gets completely empty before you add fluid you will need to bleed air from the lines again.

Pressure relief valve setting – The TGHC-60 pressure relief valve is factory set to 3000psi. This is a good setting if all of your other system components are rated to at least 3000psi. Failure to set the relief valve 200psi higher than system pressure or any other system relief valve will result in excess build up of heat. If you need to adjust the TankGuard pressure relief valve it can be accessed by removing the access panel at the bottom of the cooler and the R.V. side plug to manually adjust. The change in pressure is roughly a 125 PSI per quarter turn. Any time the side cover is off the PTO should be off as well.

Once you verify system functionality with no leaks and the proper fluid level your TGHC-60 is ready for operation.

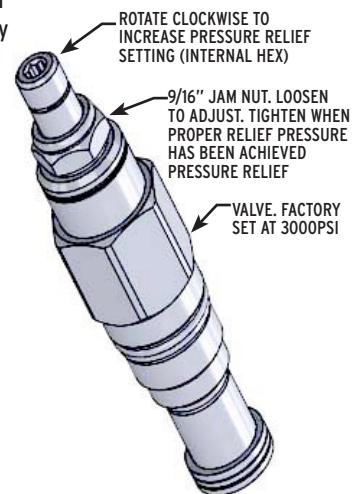

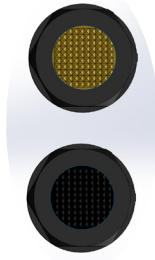

## SYSTEM MAINTENANCE:

**Filter** – Unscrew filter cap (use a screw driver or tool with a square shank) and replace element every three months.

**Fluid** – Check fluid level daily (with the PTO off the fluid level should completely fill the bottom sight glass with no fluid showing in the top sight glass). Drain and replace hydraulic oil every 6 to 12 months depending on use.

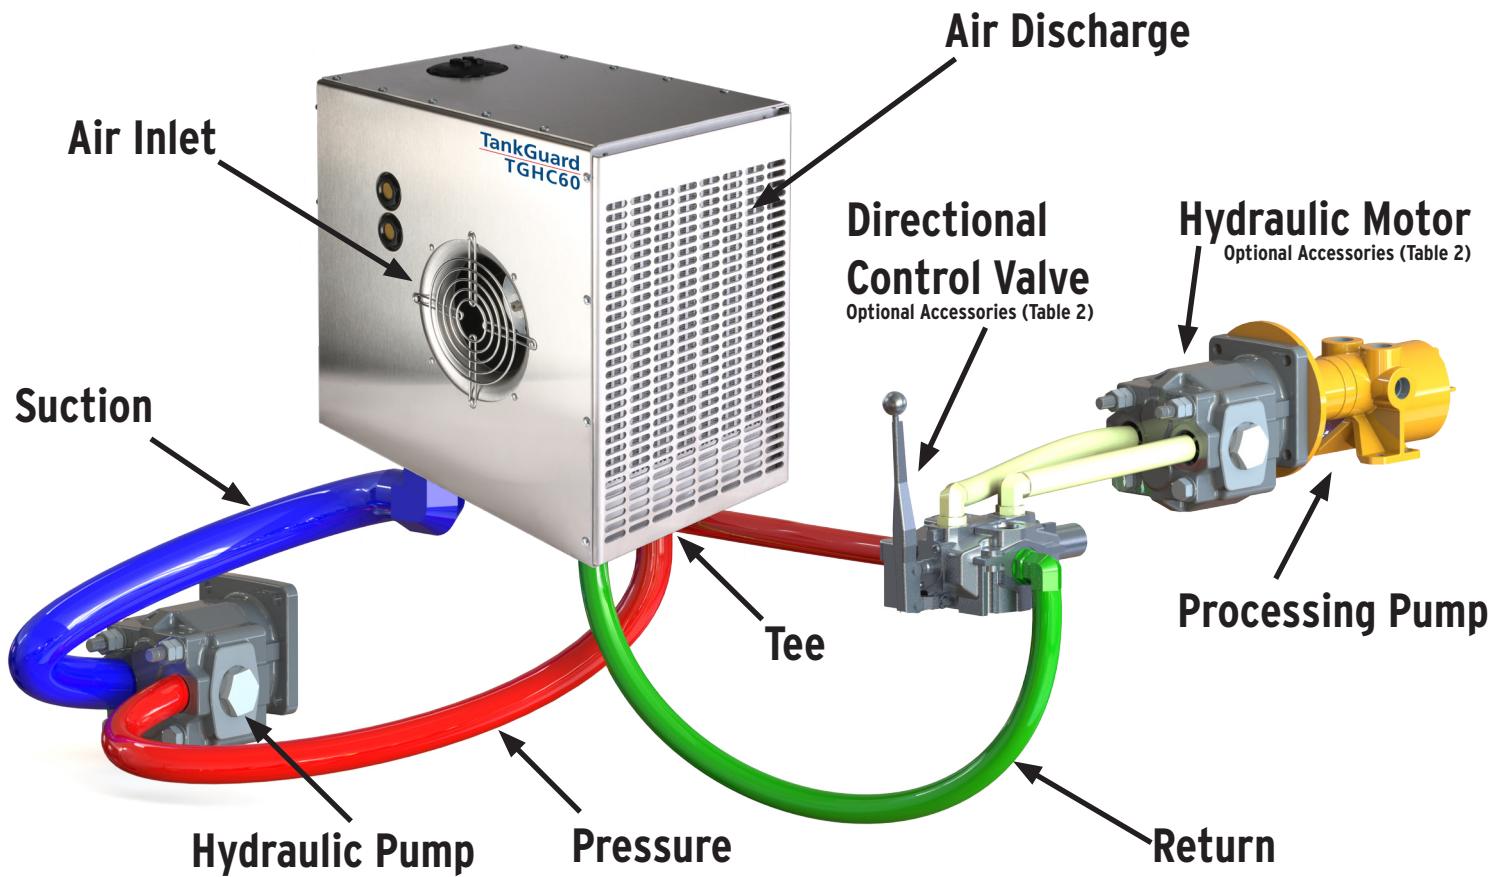

**Recommended Fluid** – Use non foaming hydraulic fluid and see Pump and Motor Manufacturer recommendations.

**Clean Radiator** – Use a mild cleaner compatible with aluminum. Be careful not to damage fins if using a power washer to rinse cleaner off of radiator. Visually inspect daily and clean if necessary.

TABLE 3: TROUBLE SHOOTING GUIDE

Problem	Cause	Corrective Action
Fan not spinning	Low system pressure Low oil level in tank Air leak in suction hose or fitting connections Collapsed Suction Hose Flow Control Valve has blocked orifice Fan sucked in road trash such as a plastic bag and has caused fan to be in a bind	The system pressure must be higher than 1000 psi for the fan to spin at full speed. Slower fan speeds in an unloaded condition are part of normal operation Fill Tank, tighten fittings, and bleed air from lines Tighten fittings and bleed air from lines Replace suction hose Remove and clean or replace valve. Change fluid and filter element With Unit de-energized, remove debris, check for proper torque of hub bolts. Check to make sure the fan is not broken or cracked and motor functions properly
High Oil Temperature	Dirty Heat Exchanger Assembly System Relief Valve is opening low oil level in tank Collapsed Suction Hose Air leak in suction hose or fitting connections	Clean Heat Exchanger. Use mild cleaner compatible with aluminum. Be careful not to damage fins when using a pressure washer. Ensure that valve relief pressure is set higher than your system pressure. Remove and clean or replace valve. Change fluid and filter element Fill Tank and tighten fittings Replace suction hose Bleed air and tighten fittings
Aeration of oil (Milky looking oil)	Water Contamination Air leak in suction hose or fitting connections Pump is not lower than the tank Restricted suction line low oil level in tank	Replace Fluid and Filter Element. Check all fittings and Filter Cap for tightness Tighten fittings and bleed air from lines Reposition to ensure the fluid can gravity feed into the pump through the suction line. Route suction line to make as straight and short of a run as possible. Ideally you would want a 2.5" suction line for minimum flow restriction. Fill Tank and tighten fittings, verify proper fill level before use
Heat exchanger Assembly leaks	Loose Fittings or cut o-rings Burst Heat Exchanger	Replace o-rings and tighten fittings Replace Cold start relief valve and Heat exchanger assembly

## TGHC-60 REPAIR: (Refer to FIG.5, Table 4)

Be sure to turn off PTO, lockout unit, allow time for fluid to cool, and bleed hydraulic pressure, before removing any body panels or hoses on or connected to TGHC-60.

Drain hydraulic fluid from unit by removing the case drain plug (Item 17, FIG.3), once all the fluid has been drained replace and torque according to Table 1. Do not re-use this fluid. Remove all connections to the TGHC-60, these connections will be wet so be sure to have a catch pan for the fluid that will be spilled. Cap and plug all hoses and ports to prevent contamination. It is recommended to do any repair work on a clean surface in a dust free environment.

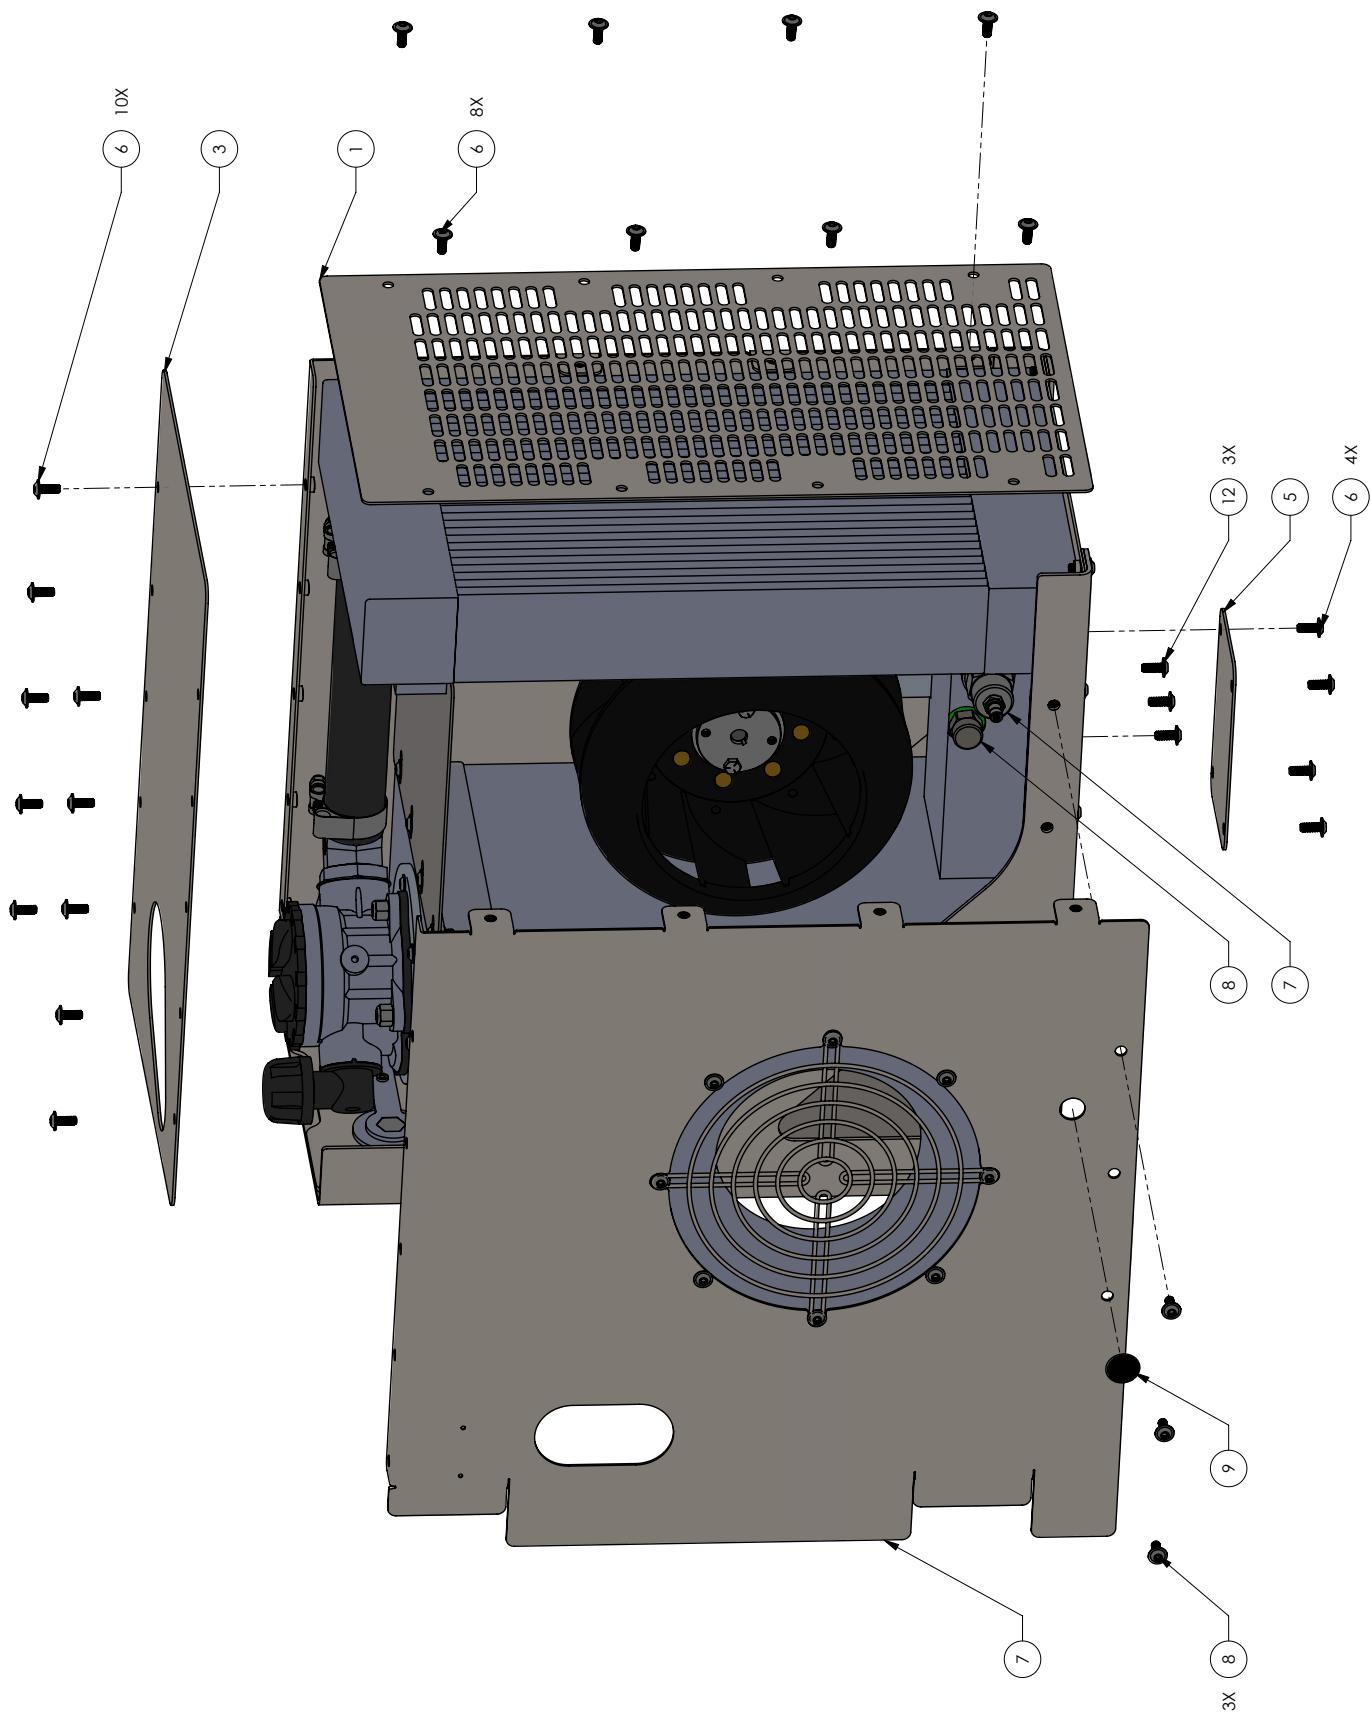

Most repairs, such as fan, motor, relief and flow control valves, can be accessed by simply removing the left side panel then removing and replacing the part. To remove the left side panel (Item 7, FIG.5) you

must remove the front and top panels as well. If more in depth repairs are necessary, simply remove the three manifold bolts and the two radiator bolts that fasten the manifold and radiator to the base plate. The entire internal assembly can then be lifted out of the frame. Once the TGHC-60 is out of its frame you will be able to remove and replace any of the components. If the repair requires you to remove the tank mount bracket (Item 24, FIG 4) mark the position of the bolts on the tank mount bracket so you can reinstall in the same position. This will ensure that your sight glass and tank caps will fit concentrically within the case when you put the TGHC-60 back together. When you re-assemble the TGHC-60 be sure use blue loc-tite on all fasteners and torque according to Table 1.
